

# Gel-One

## The arthritic knee

Arthritis is a disease that typically worsens over time, so it is common for treatment to involve more than one approach. Arthritis of the knee occurs when cartilage, the protective tissue surrounding the knee, gradually becomes worn down, resulting in loss of lubrication surrounding the knee. The good news is that knee arthritis pain can be treated.

- A.** Cartilage wears away **B.** Bone spurs may develop **C.** Joint fluid breaks down  
**D.** Gel-One replaces joint fluid

## Viscosupplementation Treatment

Synovial fluid, containing hyaluronan is a naturally-occurring lubricant or cushion present in your knee that helps your knee joints work efficiently and without friction. Gel-One can be injected into the knee to cushion, lubricate and improve knee function.
